

Certification Statement of the Frequencer® acoustical technology

Dymedso is a leading Canadian-based company specialized in the airway clearance device industry for the treatment of patients with Cystic Fibrosis (CF) and other lung ailments. With our unique patented technology, our company is committed to improving patient care while helping to save lives. Our team has spent the last several years demonstrating the effectiveness and safety of our device for treating patients with critical lung conditions. Most recently, this includes the treatment of COVID-19 patients in hospital Intensive Care Units (ICU) in Canada and abroad as well as in long-term care facilities.

The Frequencer® is a scientific innovation that has revolutionized the approach to airway clearance by using **proprietary acoustic sound waves** to treat respiratory conditions such as Cystic Fibrosis, Chronic Obstructive Pulmonary Disease (COPD) and Bronchiectasis. The device is clinically proven and has been approved for use by Health Canada, the United States Food and Drug Administration and the European Community.

The Frequencer® provides soft, non-invasive chest physiotherapy via the media of inaudible sound waves that match the resonance frequency of the lung's mucus. These sound waves cause the lungs to vibrate changing the viscosity of the mucus, dislodging it, and ultimately unblocking the airways allowing the patient the capacity to better fight the infection. The chest physiotherapy that is available through our unique device has been demonstrated to be essential for treating the symptoms of pneumonia and acute respiratory distress (ARDS), which are often found in COVID-19 patients.

Today the Frequencer® is used by renowned hospitals in the United States and Canada in the neonatal intensive care units (NICU) and intensive care units (ICU) to treat critical care patients. It is also safely and successfully used on mechanically ventilated patients.

Dymedso Inc. holds numerous, Certifications, Trademarks & Patents.
